INSTRUMENTAL SOFTWARE ASTRA. IDE 56

INTEGRATED CONTROL SYSTEM ASTRAREGUL 58

REGIAB

Microsemi

PART NUMBER FOR ORDER REGUL RX00

RX00 S AI 08881 (X)-000-A AA

PLC model:

R500, R500S, R400, R000

Additional symbol for special PLC's version
(only for R500):

G — gateway

S — safety

Тип модуля ПЛК:

Type of PLC's module:

CU — central processor unit

AI — analog input module

AO — analog output module

AS — analog input and output module

DI — digital output module

DS — digital input and output module

DO — digital output module

DA — frequency measurement / pulse counting module

CP — communication processor module

PP — power supply module

ST — terminal module

EU — extension CPU's net-ports module

PO — power supply module for sensors

CH — chassis module

CL — terminal block for I/O modules

DN — DIN-rail for PLC's modules mount

Number of channels in module

Serial number of the module in the model range (XX-)

and development number (--X)

Additional symbol for WEB-access option in CPU:

W - WEB-server embedded license

Code for the set of options applicable to the module:

000 — no options

Option code, applicable to PLC's model:

A - no options

C - protective coating of module boards

(against moisture, aggressive environments)

Code of options required by a specific Customer

PROGRAMMABLE LOGIC CONTROLLER REGUL R500

It's included in reestr of production,
which manufactured in Russia,
№ of note 140\1\2023.

Controller REGUL R500 is designed to build responsible,
fault-tolerant and distributed APCS in various industries.

MAIN CHARACTERISTICS

● Purpose

important ACS is needed
to be strongly reliability
(supporting of different redundancy
schemes of CPU and remote I/O racks)

highly accurate measurements
(special measurement modules
with low error)

fault-tolerant control systems
for technological objects with quickly
changed processes (redundant control
systems with lowest application cycle,
special modules for high-speed
measurements of physical parameters)

distributed control systems

● Functional availability

- supporting of hot redundancy CPU, power supply, I/O modules
- dual high-speed internal data bus
- different schemes of PLC's redundancy (100% redundancy, redundancy of power supply modules and CPU)
- Hot swapping for any controller module (without power shutdown and application software stopping)
- discrete rack - extension of rack by one module is available
- remote I/O racks are connected to CPU's rack in different topologies: "double redundancy ring" "star", mixed topology
- power independent memory - up to 3 Gb (in basic version) for user archive
- web-visualization availability
- design software Astra.IDE supports all languages according to IEC 61131-3 and CFC

● Available communications

Communication protocols embedded:

- HART v6, v7;
- IEC 60 870-5-101 (Master / Slave);
- IEC 60 870-5-104 (Master / Slave);
- Modbus RTU (Master / Slave, including extension availability);
- Modbus TCP (Master / Slave, including extension availability);
- OPC DA, OPC UA;
- Profibus DP v1 Master;
- RegulBus, SQL, FTP, SNMP v3, SysLog;
- additional protocols, also non-standard protocols according to customer's task can be realized.

Interface support:

- | | |
|---------------------|---|
| • USB host 2.0; | • RS-485; |
| • DVI video output; | • Ethernet 100/1000 Mbps RJ-45 (full duplex) — up to 4 ports in CPU module; |
| • RS-232; | • Ethernet 100/1000 Mbps FO (single-mode, multi-mode)
— up to 2 ports in CPU module. |

● Construction

modern design
of modules

flexible remount
terminal blocks

quick mount
on 105 mm DIN-rail

passive
cooling

● Technical characteristics

Minimal application cycle time	1 ms/10 ms in redundancy configuration
CPU switching time from Active to Stand-By	up to 5 ms
Accuracy of time synchronization	up to 50 µs
Power supply voltage	85...264 V AC / 120...370 V DC, 18...36 V DC
Operating temperature range	from -40 to + 60 °C

● Part number for controller order

see at page 6

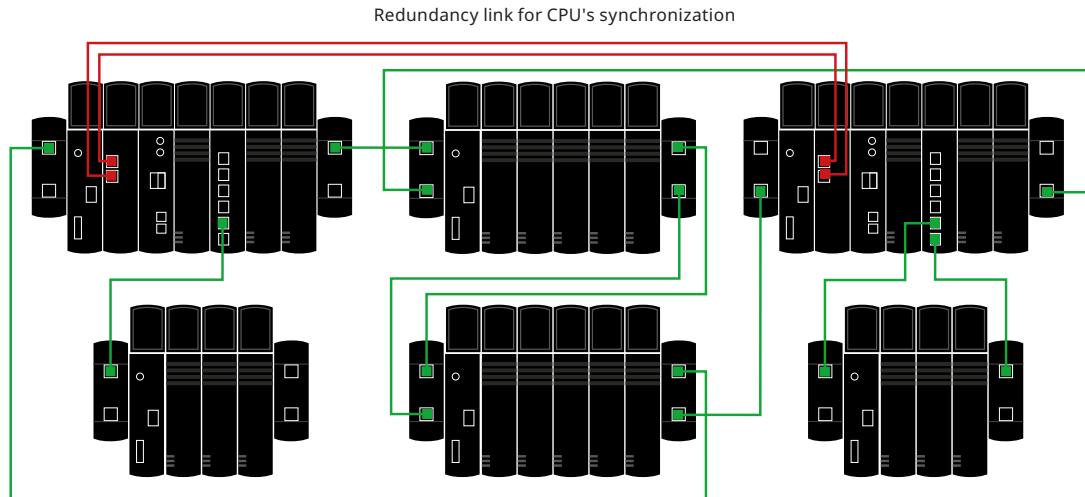

● Noise immunity

see at page 52

HARDWARE CONFIGURATION OF CONTROLLER REGUL R500

- PLC redundancy is available with CPU's mounting in the one rack or in the different racks
- remote I/O racks are available
- up to 25 modules in one rack
- up to 10 km link between racks is available (by fiber optic link)

Figure 1.
Example of REGUL R500
racks connection

PLC CONFIGURATION

PLC REG UL RS00 allows distributed configuration of racks. Up to 20 racks (electrical different units) can be configured in one controller. Each rack must have unicum address, that is configured by 8-position dip-switcher, that is located on terminal module (ST). PLC's racks can be connected between each other in any order, but interface connectors "OUT" of internal PLC's data bus - RegulBus always connect to interface connectors "IN".

PLC REGUL RS00 allows configuration with double internal data bus and double or one internal power bus. In CPU's redundancy configurations double RegulBus must be used.

RS00 rack includes modules of following types:

(ST) Terminal modules must included in each PLC's rack. They installed on both ends of the rack, provide fixation of the crate on the DIN-rail and protect the chassis electrical lateral connectors.

Terminal modules of the corresponding modification can support extension PLC's internal data bus (IN and OUT modules) via twisted pair or fiber optic line between racks. At communication via FO in the terminal modules must be installed are third-party SFP-modules. In PLC's configuration with rack expansion, then all terminal modules of all crates must support function of Regulbus extension.

(PP) Power supply modules. At least one module must be included in the each rack. Number of power supply modules selected depending on the internal power consumption of each rack. For providing redundant power to the rack PLC must apply an excess amount of power supply modules. Selection features chassis and PP-modules supporting two independent power buses are given in system manual for Regul R500.

(CU) Central processor unit. CU modules have different types of modules and options.

(AI, AO, AS / DI, DA, DO) I/O modules have a wide nomenclature, provide processing of analog (including HART support) and digital signals (including NAMUR support), signals from TC/RTD, pulse signals (including incremental encoder signals and output PWM-signals).

(CP) Communication processor modules. CP modules provide reception and operation of signals via interfaces RS-485, Ethernet and protocols Mod bus RTU /TCP, !EC 60870-5-101/104, RegulBus, NVL, SQL,FTP, SNMP, Profibus DP v1 Master. CP modules can be installed in remote PLC's racks. CP modules provide only the physical connection devices, device driver processing executed in CU modules. Bandwidth of Ethernet CP modules is limited volumes of segments of the PLC's internal bus, allocated for data transmission via such CP modules.

(EU) Extension CPU's net-ports modules. EU modules further expand the number of CU series 151 /161 /171 /181 ethernet interfaces. Each CU may not have more than two EU. Data processing of devices connected to the EU is carried out in the CU modules. EU modules can only be installed in a rack to the right of CU series 151/161/171 /181 modules.

(PO) Power supply modules for external sensors. PO modules provide power by 24 VDC (up to 70 mA on each channel) for circuits of external analog current sensors. PO modules are usually installed next to the AI modules.

(CH) Chassis modules. For each PP, CU, I/O, CP, PO, EU module chassis module must be mounted in rack. Chassis modules provide active data and power buses of PLC and provides hot swapping any of these modules in rack. PLC's R500 rack can be mounted by one chassis module. Chassis modules are not supplied with the PLC's modules and must be ordered separately.

(DIN) DIN-rail. Chassis mount on DIN-rail, which have 105 mm height. DIN-rail can be mount on panel or in 19"-cabinet. DIN-rails have standard sizes by 600, 800 or 1000 mm width. Chassis for CU I and III types have 80 mm width, other CH and ST modules have 40 mm width.

The installation location of the module type in the rack does not matter, except for terminal modules, which always mounted on both ends of the rack, and EU modules always mounted next to the CU's type of III.

Two redundant CU or PP modules can be installed in one rack. To increase reliability, it is recommended to: reserve PP modules in each crate, install redundant CUs and I/O modules in different crates, use chassis and interface modules with support for two power buses.

Figure 2. Example of PLC's REGUL R500 rack configuration

● Types of central processor units

Central processor unit	CU 00 021	CU 00 031	CU 00 051	CU 00 061	CU 00 071	CU 00 151	CU 00 161	CU 00 171	CU 00 181			
CPU's type	II		I			III						
Frequency, GHz, number of microprocessor cores	1 (1 core)		1,33 (2 cores) 1,93 (4 cores)			1,33 (2 cores) 1,93 (4 cores)						
RAM, Mb	512		2000			2000						
Flash memory, base modification, Gb	1		4			4						
Flash memory, extension option, Gb	-		Up to 64			Up to 64						
RS-232 / RS-485, pcs.	1 / 1											
Ethernet, 100 Mbps, pcs.	2 (RJ-45)	2 (SFP)	-	-	-	-	-	-	-			
Ethernet 100/1000 Mbps, pcs.	-	-	4 (RJ-45)	2 + 2 (SFP)	2 + 2 (SFP)	4 (RJ-45)	2 + 2 (SFP)	2 + 2 (SFP)	4 (RJ-45)			
Video output, DVI, pcs.	-	-	-	-	1	-	-	1	1			
USB, 2.0**	-	-	2	2	2	2	2	2	2			
SDHC-card slot, pcs.	1 (32 Gb, FAT32)		-			-						
Option for WEB-access	Yes											
EU connection is available	No		No			Yes						
GPS / GLONASS receiver	No		Embedded			Option						
Typical PLC's bus cycle	5 ms on each rack		1 ms on each rack			up to 1 ms by 350 I/O modules up to 3 ms by 1000 I/O modules						
Minimal application cycle time	10 ms / 20 ms at redundant configuration		5 ms / 10 ms at redundant configuration			5 ms / 10 ms at redundant configuration						
Typical number of PLC's channels at PLC's application cycle for 200 ms	Up to 800		Up to 3000			Up to 3000						
Typical number of tags for data transfer from PLC	Up to 5 000		Up to 30 000			Up to 30 000						
CPU's battery replace is available by user*	No					Yes						
Ad-processor for RegulBus	No					Yes						
Compatible chassis module	CH 02 032		CH 02 022, CH 02 023			CH 02 022, CH 02 023						

Note: * battery in CU module provides work only for internal clock, when external power shut off. When the CU module is powered on with a faulty battery, the date and time in the CU can be set manually, the CU module time synchronization can be done via NTP or from the built-in GPS / GLONASS receiver;

** an external flash drive up to 32 GB in size, or a touch-screen display, or a keyboard / mouse can be connected via USB.

MANAGED SWITCH FOR REGULBUS - REGUL R000

REGUL R000

Managed switches REGUL R000 provide flexible structure of PLC REGUL racks.

It's included in reestr of production, which manufactured in Russia, № of note 140\1\2023.

The main purpose of switches is to split the PLC on different net nodes by territory and / or functional features.

The general net forms by internal PLC's bus (RegulBus), in which managed switch REGUL R000 splits its on following parts:

- upper domain of racks is a part of net before switches, in which CPU modules are located;
- lower domain of racks is a part of net under switches, in which switches can manage the activity of links.

Managed switches provide diagnostic of errors in net and block automatically, in some milliseconds from error occlusion, the lower parts of the PLC's net (RegulBus). Therefore it saves PLC's distributed net from failures in some node.

Managed switch do not read or modify RegulBus data, so it don't influent on data transfer time between upper and lower parts of RegulBus.

Also managed switches REGUL R000 can be used as media converter thus converted fiber optic RegulBus to twisted pair if it necessary.

● Functional availability

it provides on their net-ports up to three "ring" schemes or up to six "star" schemes, also it allows the mix of these schemes

fault or modify detection of data are available with following block these net section

remote control (opening and closing) of the switches ports available

diagnostic information about link status available for users

two power supply connectors

● Construction

Regul R000 has size of 40x180x145 mm, like R500 I/O modules

DIN-rail mount (height 105 mm)

passive cooling, there are no mechanical and spinning elements on construction

● Technical characteristics

• power supply voltage	18-32 VDC
• operating temperature range	from -40 to +60°C

● Part number for controller order

see at page 6

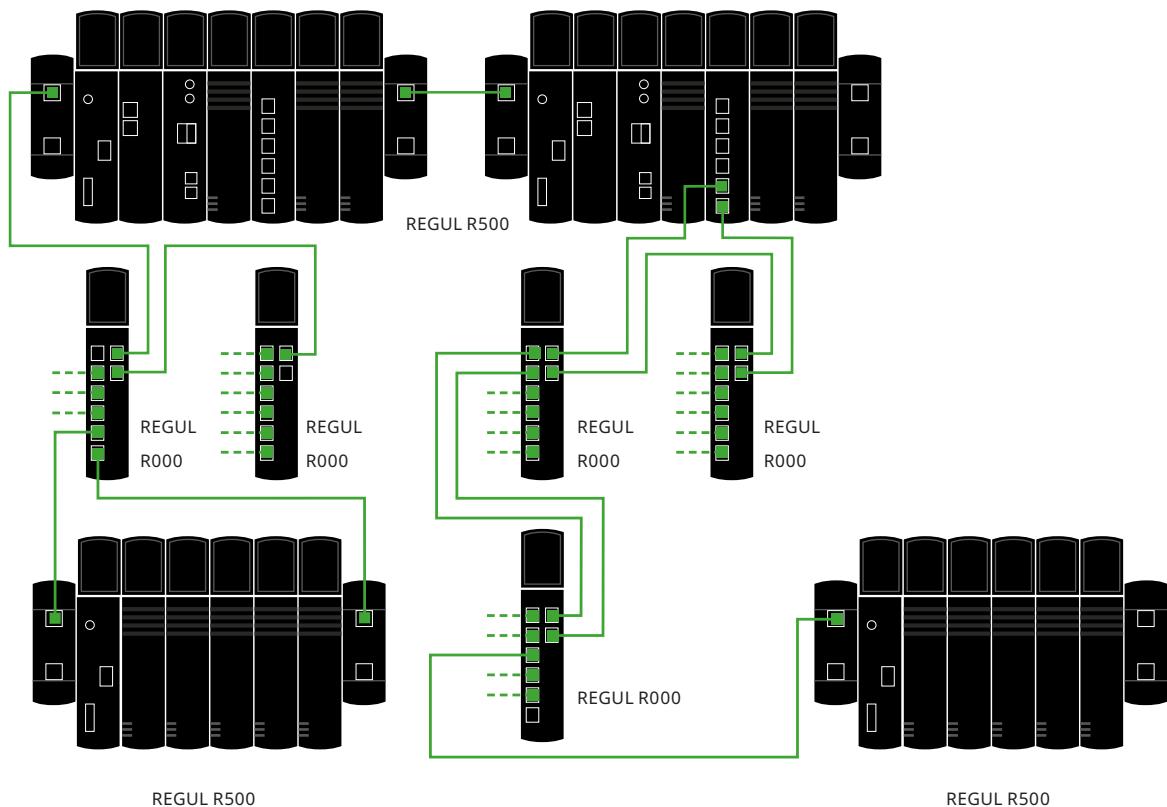

● Noise immunity

see at page 52

PROGRAMMABLE LOGIC CONTROLLER FOR ESD-SYSTEMS REGUL R500S (R500 SAFETY)

It's included in reestr of production,
which manufactured in Russia,
№ of note 140\1\2023.

The image shows a yellow programmable logic controller (PLC) module with multiple digital input (DI) and digital output (DO) modules attached. A black control panel is shown next to it. To the right, there is a white certificate from KConsult CIS titled 'Certificate' for the product.

REGUL

Controller REGUL R500S is designed to build emergency shutdown systems and safety systems (ESD, F&GDS, HIPPS, etc.).

QR code

MAIN CHARACTERISTICS

● Purpose

special solution for ESD-systems
for dangerous technological processes

designed
in Russian Federation

approved for Safety Integrity Level 3 (SIL 3) according to IEC 61508,
it has international certificate from TUV's engineer
and calculated reliability parameters

For dangerous plants it's strictly important to protect staff, technological equipment and environment in case of emergency. For this purpose special safety system, independent from main control system, must be built.

Russian and international standards provide strict requirements for safety systems and its controllers, including requirements for PLC's embedded software and its application. Thus for safety systems usual industrial PLC must not be used. Controller REGUL R500S is based on serial manufactured REGUL R500 platform, but R500S has absolutely new design according to IEC 61508 / 61511 standard requirements.

Hardware of REGUL R500S is approved for SIL 3 requirements by following solutions:

- component redundancy for each channel inside I / O modules;
- redundancy of I / O modules (double or triple)
- deep self-diagnostic is checked internal errors and guarantee turn the hole process in definitely safety stage;
- in each I / O module certified microprocessor is embedded, which provides in depends on module type initial input signal checking or final logic of output signal stage. Microprocessor also has independent watchdog timer;
- two redundancy internal PLC's power buses, I / O modules have an opportunity to terminate two external power lines to supply power for external circuits. Self-diagnostic of power supply is provided constantly. In case of power buses emergency diagnostic information is available to staff. In the same time R500S operates and provides safety functions, which lets the staff to correct failures;
- Regul R500S has double data bus for transfer data between CPU and I / O modules, in case of CPU's redundancy.

For providing of high level of self diagnostic in REGUL R500S for developers wide set of control instruments for parameters of measurement and control loops is available:

- monitoring for field sensors power with short circuit and overload protection;
- depending on module type, monitoring for external circuit of analog inputs by short circuit or open circuit, and diagnostic by signals range;
- monitoring for external circuit of digital input signals by short circuit and open circuit (digital input modules according to NAMUR specification);
- digital output modules with monitoring of current in the circuits.

This deep proactive diagnostic provides timely and accurate detection of failures, so the staff have a time to eliminate malfunctions in the systems.

To ensure uninterrupted operation of process equipment, the REGUL R500S controller provides for the possibility of using redundant I/O modules (redundant assemblies) consisting of two or three modules of the same type. The obtained redundancy makes it possible to reduce the number of safe failures, i.e. failures caused not by an emergency situation at the technological facility, but by a malfunction of the ESD system, including field and controller equipment. This makes it possible to quickly replace duplicated system components without stopping the process.

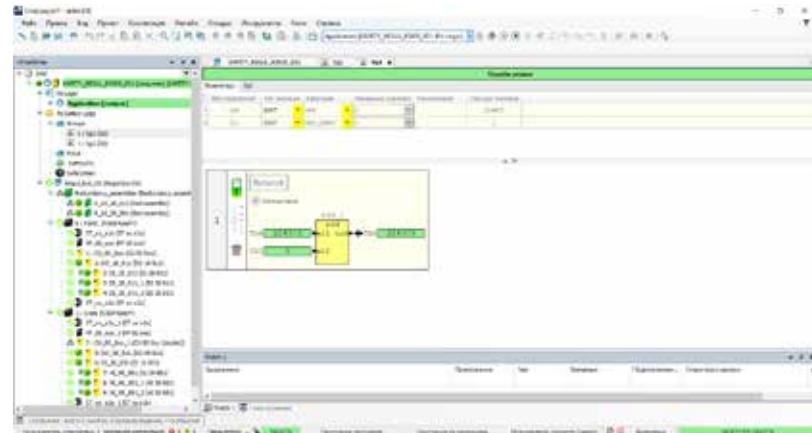

The creation of redundant assemblies is supported at the development environment level. For an assembly of two discrete input / output modules, it is possible to combine them with the logical functions "AND" and "OR", for an assembly of three modules, there is also the possibility of a majority choice - "2 out of 3".

REGUL R500S controller software:

- PLC operation is controlled by a specialized operating system certified for use in equipment with a functional safety level up to SIL3;
- built-in system software, including a secure data transfer protocol between the CPU and I / O modules, was developed by RegLab in accordance with the requirements of the IEC 61508 standard;
- the development environment is also a RegLab product created on the basis of Astra.IDE. It has its own built-in Safety editor and compiler, made in accordance with the requirements of the IEC 61508 standard.

Figure 4.

Screenshot of Astra.IDE software interface

All developed software is checked by special certified static analysis tools for compliance with the MISRA C: 2012 standard.

PLC CONFIGURATION

PLC REG UL RS00S allows distributed configuration of racks. Some racks (electrical different units) can be configured in one controller. Each rack must have unicum address, that is configured by 8-position dip-switcher, that is located on terminal module (ST). PLC's racks can be connected between each other in any order, but interface connectors "OUT" of internal PLC's data bus - RegulBus always connect to interface connectors "IN".

PLC REG UL RS00S allows configuration with double internal data bus and double internal power bus. In double CPU's configurations double RegulBus must be used.

In PLC's REGUL R500S racks R500 IO modules are also allowed. R500S rack includes modules of following types:

(ST) Terminal modules must included in each PLC's rack. They installed on both ends of the rack, provide fixation of the crate on the DIN-rail and protect the chassis electrical lateral connectors.

Terminal modules of the corresponding modification can support extension of PLC's internal data bus (IN and OUT modules) via twisted pair or fiber optic line between racks. At communication via FO in the terminal modules must be installed are third-party SFP-modules.

(PP) Power supply modules. At least one module must be included in the each rack. Number of power supply modules selected depending on the internal power consumption of each rack. To improve reliability, it is strongly recommended to install an excess number of power modules in each rack.

(CU) Central processor unit. CU modules have. different types of modules.

(AI, AO, DI, DO) Input / Output modules. I/O modules provide processing of analog (including HART support) and digital signals (including NAMUR support).

(CP) Communication processor modules. CP modules provide reception and operation of signals via interfaces RS-485, Ethernet and protocols Modbus RTU / TCP, Profibus DP v0 Master, IEC 60870-5-101/104, RegulBus, NVL, SQL, FTP, SNMP. CP modules can be installed in remote PLC's racks. CP modules provide only the physical connection devices, device driver processing executed in CU modules. Bandwidth of Ethernet CP modules is limited volumes of segments of the PLC's internal bus, allocated for data transmission via such CP modules.

Attention! Data exchange by CP modules via standard protocols, are described earlier, is not safety. According to IEC 61508 / 61511 requirements this data can not be used in safety algorithms in R500S, inspire of technical opportunity is available.

(EU) Extension CPU's net-ports modules. EU modules further expand the number of CU 00 851 ethernet interfaces. Each CU may not have more than two EU. Data processing of devices connected to the EU is carried out in the CU modules. EU modules can only be installed in a rack to the right of CU 00 851 modules.

(CH) Chassis modules. For each PP, CU, I/O, CP, EU module chassis module must be mounted in rack. Chassis modules provide active data and power buses of PLC and provides hot swapping any of these modules in rack. PLC's R500S rack can be mounted by one chassis module. Chassis modules are not supplied with the PLC's modules and must be ordered separately.

(DIN) DIN-rail. Chassis mount on DIN-rail, which have 105 mm height. DIN-rail can be mount on mount panel or in 19"-cabinet. DINrails have standard sizes by 600, 800 or 1000 mm width. Chassis for CU 00 851 have 80 mm width, other CH and ST modules have 40 mm width.

The installation location of the module type in the rack does not matter, except for terminal modules, which always mounted on both ends of the rack, and EU modules always mounted next to the CU's.

Two redundancy PP modules can be mounted in the one rack. Double CU modules of REGUL R500S must be mounted in different racks because of protection from general failure reason is necessary.

If it necessary for redundant I/O modules, they must be mounted in the different racks or in one rack. Wherever redundant I/O modules are used they should be configured as redundant assembly. Redundant I/O modules can be mounted in duplicated CPU's racks.

● Types of central processor units

Central processor unit	CU 00 821	CU 00 831	CU 00 851		
Frequency, GHz, number of service microprocessor cores	1 (1 core)			1,33 (2 core)	
Frequency, MHz, number of safety microprocessor cores	220 (2 core)			330 (2 core)	
RAM, Mb	512			2000	
Flash memory, Gb	1			4	
RS-232 / RS-485, pcs.	1 / 1				
Ethernet 100 Mbps, pcs.	2 (RJ-45)	2 (SFP)	-	-	-
Ethernet 100/1000 Mbps, pcs.	-	-	4 (RJ-45)		
USB 2.0**	-	-	2		
SDHC-card slot, pcs.	1			-	
EU connection is available	No			Yes	
GPS/GLONASS receiver	No			Option	
Minimal PLC's bus cycle	10 ms for each rack			0,5 ms for each rack	
Minimal application cycle time	50 ms			30 ms	
Number of I/O R500S modules, not over, pcs.	30			60	
Typical number of I/O channels, including redundant, pcs.	375			750	
CPU's battery replace is available for users*	No			Yes	
Compatible chassis module	CH 02 032			CH 02 022,CH 02 023	

Note: * battery in CU module provides work only for internal clock, when external power shut off. When the CU module is powered on with a faulty battery, the date and time in the CU can be set manually, the CU module time synchronization can be done via NTP;

** an external flash drive up to 32 GB in size, or a touch-screen display can be connected via USB.

BUILDING A SAFETY INSTRUMENTED SYSTEM BASED ON REGUL R500S

Each separate Regul R500S module provides SIL 3 because of each its internal component is redundant and module has internal diagnostics. Due to this feature for SIS configuration up to SIL 3 single configuration of R500S is enough.

Only power supply modules must be doubled. And every power supply module must be configured to connection for one of double internal power buses.

For protection of safe failures in Regul R500S redundant assemblies of I/O modules are available. For convenience of redundant assemblies using special terminal panels can be used. This panels allow separating or summing of signals via third-party converters, also provides Ex-protection via third-party Exi-barriers. Terminal panels can separate internal signal from one sensor to several R500S modules or can summed several signals from output R500S modules to one control signal.

In case of using a redundant assembly input modules, at the application program level are available to the developer as individual data from each module from the redundant assembly, and the final value of the technological parameter obtained based on the sample and comparison of readings from each module. Setting the sampling algorithm itself is also available to the user and includes parameters such as decision-making scheme (1oo3, 2oo3), reliability limits, signal safety criteria (which signal is considered safer: large or less, "0" or "1"), etc.

For redundant assemblies of discrete output modules, the function of diagnosing the failure of external switching equipment can be implemented by alternately disconnecting the parallel contacts of the control circuits of the actuators. In such schemes, alternating switching with a large cycle (hours) makes it possible to timely detect sticking of equipment contacts and reduce the percentage of undiagnosed dangerous failures.

Figure 5. Single configuration of Regul R500S

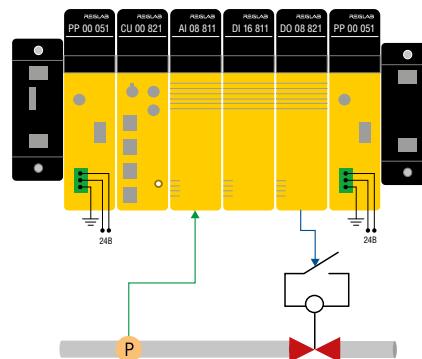

Figure 6. Redundant assembly of Regul R500S input modules

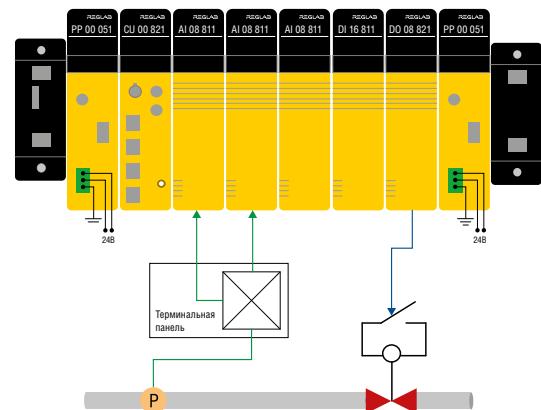

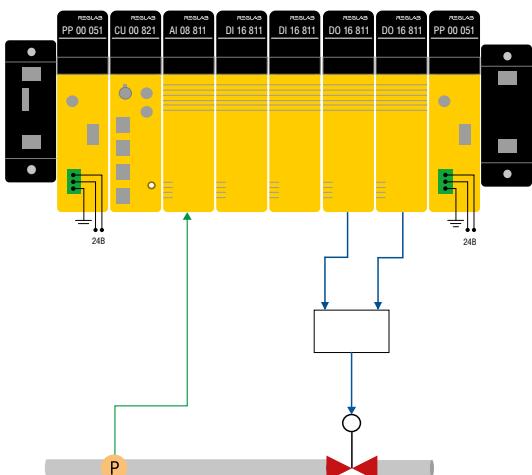

Figure 7. Redundant assembly of Regul R500S output modules

The use of a safety data channel in the REGUL RS00S controller for data exchange between controllers, as well as modules within the PLC, allows the use of standard means of communication, while separating data that is and is not involved in safety functions.

In general, the same rules for constructing racks and connecting racks to each other apply to the REGUL RS00S controller as for the REGUL RS00 controller. And the use of end modules with SFP-connectors allows users to install expansion racks at a distance up to 10 km from the central processor rack, bringing measurement and control modules closer directly to the technological object, thereby reducing the length of signal lines and increasing the reliability of the SIS as a whole.

As part of the REGUL RS00S controller, you can use all I/O modules and communication modules from the REGUL RS00 controller range. Information with these modules can be used to obtain additional diagnostic information or to transfer data from and to the DCS controller or at the SCADA-system level. But the architecture of the REG UL RS00S controller is designed in such a way that data from the REGUL RS00 controller module operating as part of it is guaranteed not to be used in the security algorithm.

For continuous production and technological processes, the shutdown of which leads to temporary losses, the architecture of the REG UL RS00S controller allows the development of duplicate control systems operating according to the 1oo2D scheme.

At the same time, in contrast to classical redundancy, in RS00S both central processors are leading and a qualified decision that a technological object needs to be transferred to a safe state is made by either of the central processors. But at the same time, any safe failure of the controller will not lead to a stop of the technological cycle - only degradation of the controller will occur from the 1oo2D circuit into a single-channel SIS controller. This gives the operating personnel time to carry out all the necessary manipulations to repair and replace failed equipment.

At the same time, again thanks to the REG UL RS00 controller platform, the developer has access to all the numerous schemes for constructing a duplicate system as with the standard RS00 controller. It is full duplication, duplication of only central processor modules, with central processor modules placed in different racks.

Figure 8. Regul RS00S configuration with full doubled of modules

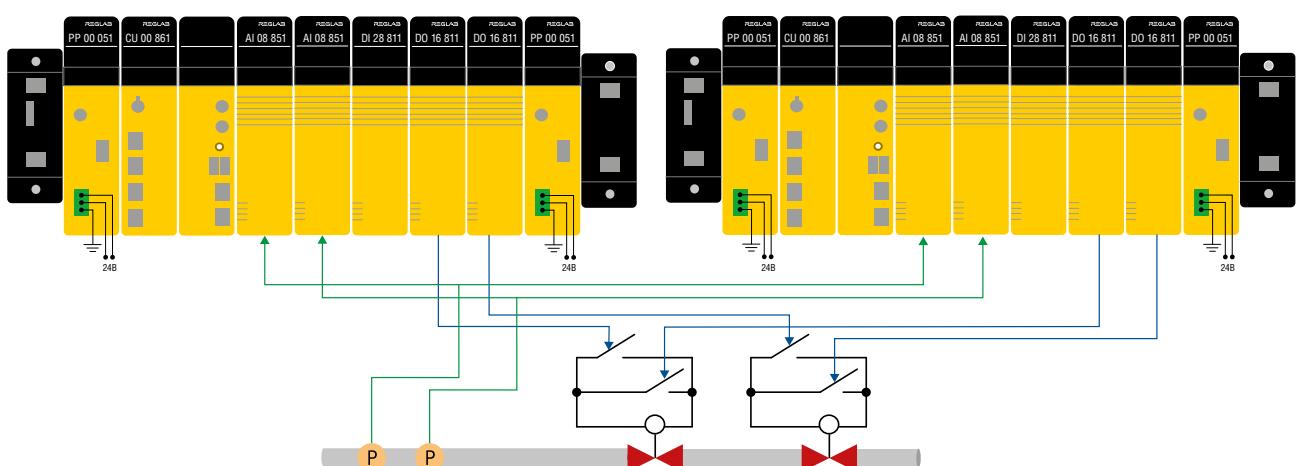

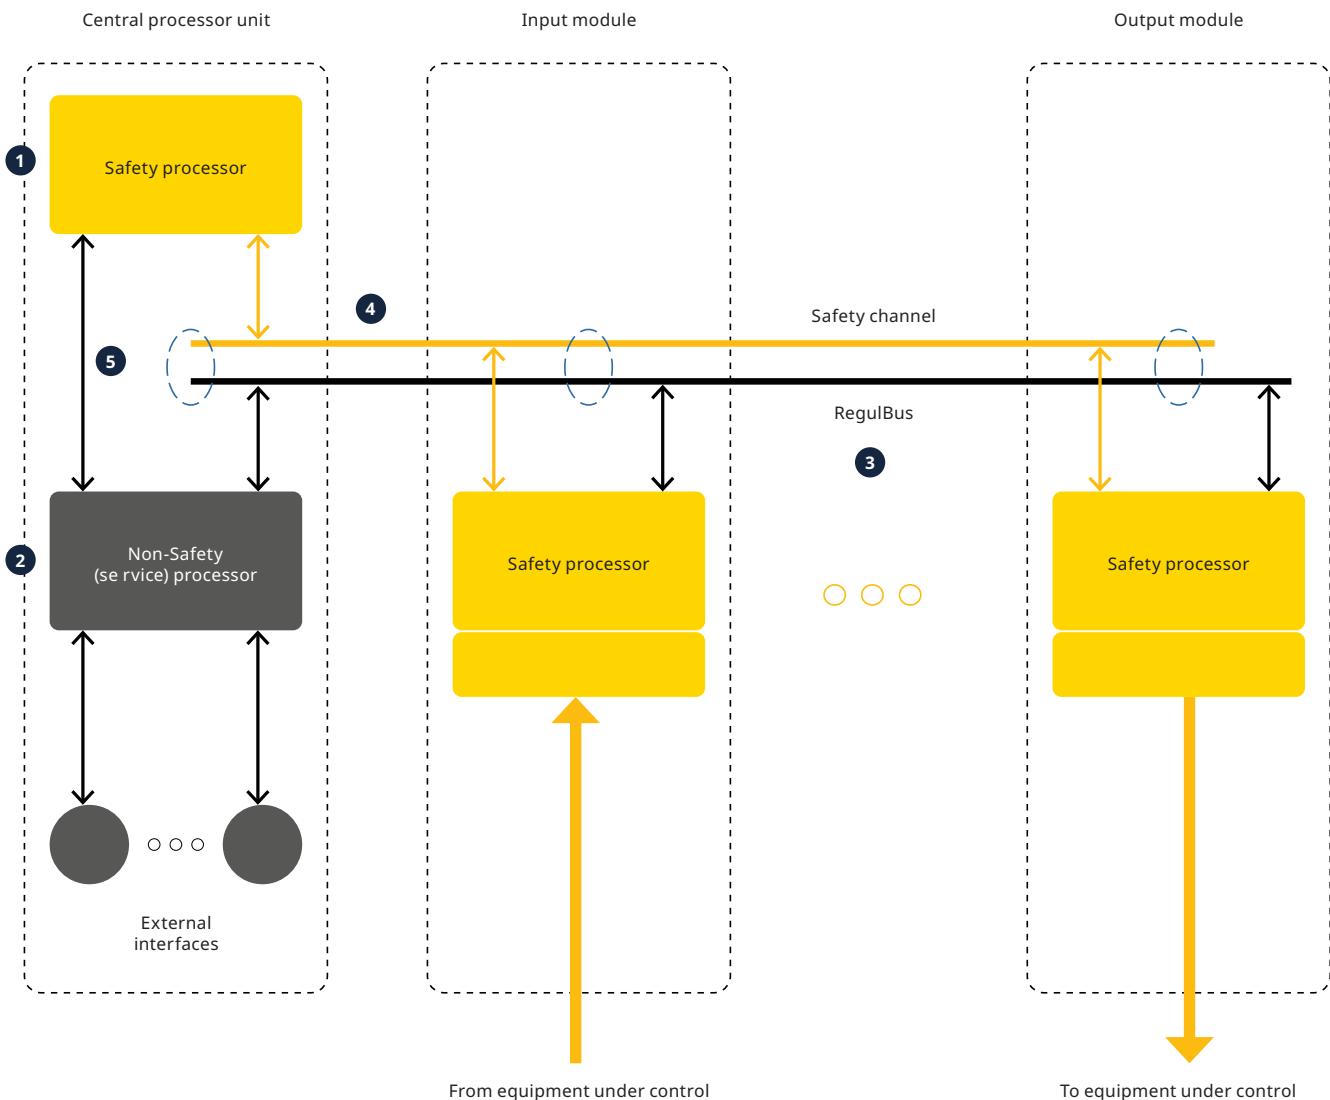

Figure 9. Regul RS00S architecture

- Safety subsystem
- Non-safety subsystem
- ① Safety processor
- ② Non-Safety processor
- ③ Non-Safety internal data bus - RegulBus
- ④ Internal safety bus ("black channel" over RegulBus, FSC technology)
- ⑤ Non-safety network between processors

Channel No. 5 is duplex. Transmission (recording) of data from Non-Safety part into Safety part of Regul R500S is available, but this procedure in "on-line" mode is prohibited by IEC 61508.

Data from Safety-modules can be transferred strictly to non-safety processor.

PROGRAMMABLE LOGIC CONTROLLER REGUL R400

It's included in reestr of production,
which manufactured in Russia,
№ of note 140\1\2023.

Controller REGUL R400 is
combination human-machine
interface and central processor unit.

It works with any I/O modules
of controllers REGUL RX00 series.

MAIN CHARACTERISTICS

● Purpose

REGUL R400 controller is designed for local and distributed automation systems with visualization support.

● Functional availability

capacitive touch-screen
with a diagonal of 7"

ability to create a user archive on
the built-in solid-state drive

film keyboard

connection of REGUL RX00 series
controller expansion racks

degree of protection of the front
panel against penetration
of solid objects and water IP 66

web visualization capability

extended operating
temperature range

instrumental software Astra.IDE
with support for all IEC 61131-3
standard languages

● Technical characteristics

Screen diagonal	7"
Screen permission	800 x 480 px
RAM	2 Gb
SSD	4 Gb
Interfaces:	
• RS-485	1
• USB host	2
• Ethernet	2
Input supply voltage range	18...36 V DC
Operating temperature range	from -20 to +60 °C

● Part number for controller order

PROGRAMMABLE LOGIC CONTROLLER REGUL R050

**REGUL**

Controller REGUL R050 is a compact solution
for building local control systems

MAIN CHARACTERISTICS

• Purpose

local automation systems on industry
and administrative objects

territory distributed systems (telemechanic systems),
monitoring systems

distributed remote racks for input / output of field signals
within REGUL R400 or non-redundant REGUL R500 configurations

● Functional availability

- supporting of hot redundancy power supply modules for internal power bus
- high-speed internal data bus (for the racks connections)
- discrete rack - extension of rack by one module is available, rack mount on DIN-rail 35 mm height
- remote I/O racks are connected to CPU's rack in different topologies: "redundancy ring", "star", mixed topology
- power independent memory - up to 0,5 Gb for user archive
- design software Astra.IDE supports all languages according to IEC 61131-3 and CFC

● Available communications

Communication protocols embedded:

- HART v6, v7;
- IEC 60870-5-101 (Master / Slave);
- IEC 60870-5-104 (Master / Slave);
- Modbus RTU (Master / Slave, including extension availability);
- Modbus TCP (Master / Slave, including extension availability);
- OPC DA, OPC UA;
- RegulBus, FTP, SNMP v3, SysLog;
- additional protocols, also non-standard protocols according to customer's task can be realized.

Interface embedded:

- USB host 2.0;
- RS-485;
- Ethernet 100 Mbps RJ-45 (full duplex) — up to 4 ports in CPU;
- Ethernet 100 Mbps FO (Single-mode, Multi-mode) — up to 2 ports in CPU.

● Construction

fast mount
on DIN-rail 35 mm height

passive cooling

● Technical characteristics

Minimal application cycle time	10 ms
Accuracy of time synchronization no worse	50 µs
Power supply, voltage	18...30 VDC
Operating temperature range	from -40 to +60°C

● Part number for controller order

see at page 6

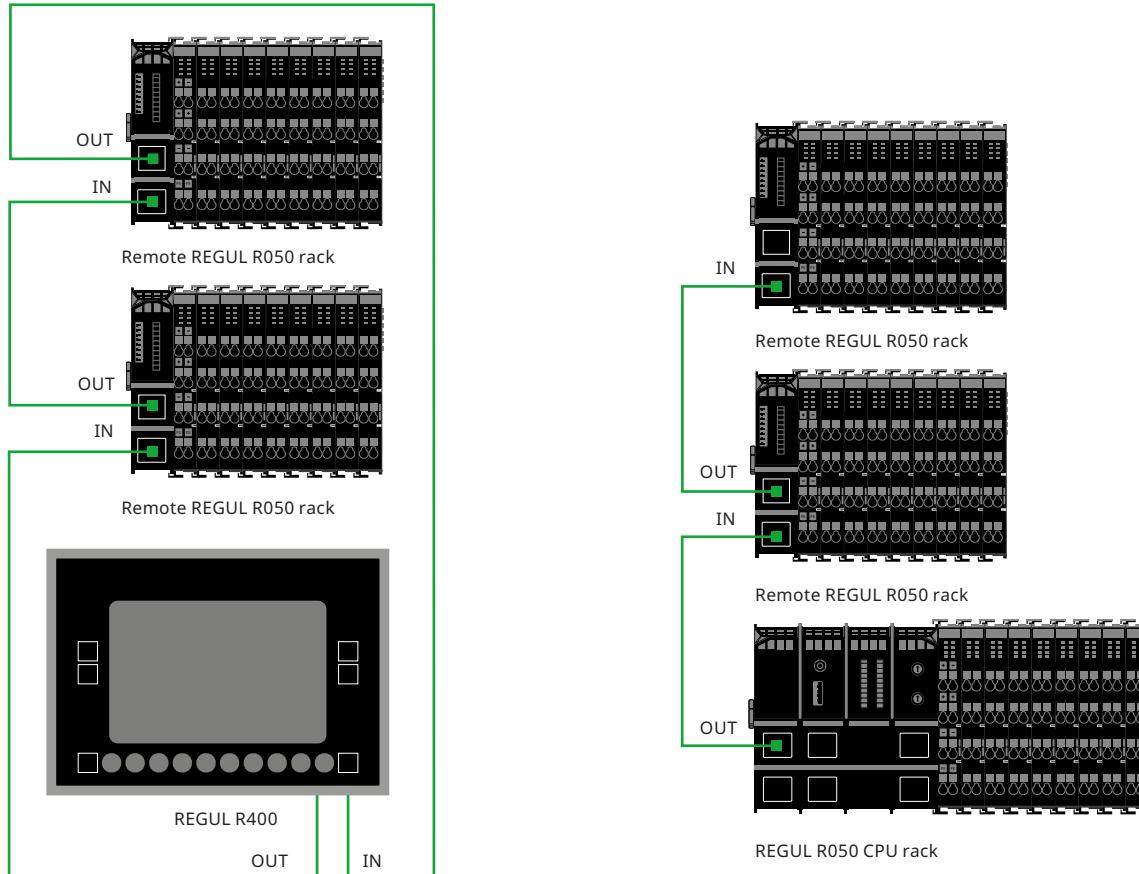

● Noise immunity

see at page 52

HARDWARE CONFIGURATION OF CONTROLLER REGUL R050

- up to 70 modules in one rack
- remote I/O racks are available
- up to 10 km link between racks is available (by fiber optic link)

Figure 11. Example of REGUL R050 racks connection

PLC CONFIGURATION

PLC REGUL RS00 allows distributed configuration of racks. Up to 20 racks (electrical different units) can be configured in one controller. Each rack must have unicum address, that is configured by 8-position dip-switcher, that is located on terminal module (ST). PLC's racks can be connected between each other in any order, but interface connectors "OUT" of internal PLC's data bus - RegulBus always connect to interface connectors "IN".

ROSO rack includes modules of following types:

(ST) Terminal module must include in each PLC's rack. The module is installed in the extension rack on the left, the ST module supports extension of the internal PLC bus (IN and OUT connectors) via twisted pair or fiber optic line between racks. At communication via FO in the terminal modules must be installed third-party SFP-modules. Each ST module also comes with a power supply module (PP) and plug to protect the electrical contacts of the rightmost module in extension rack.

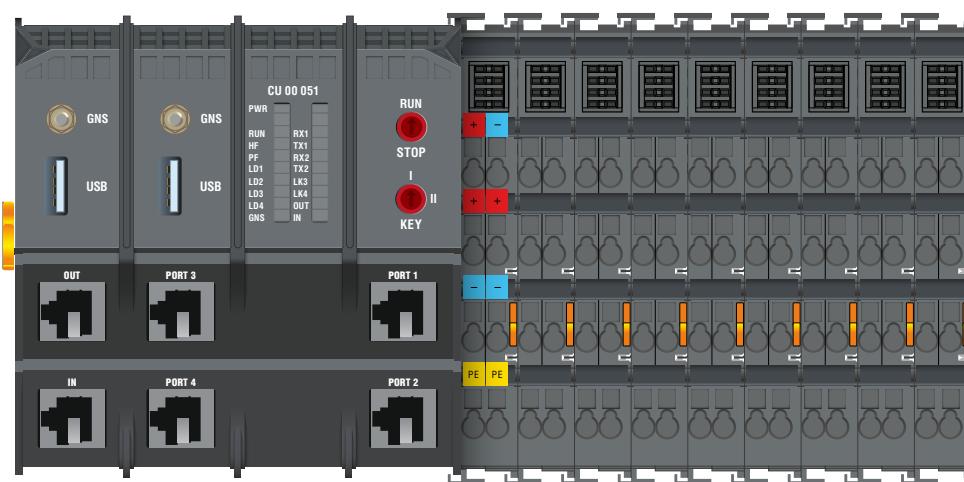

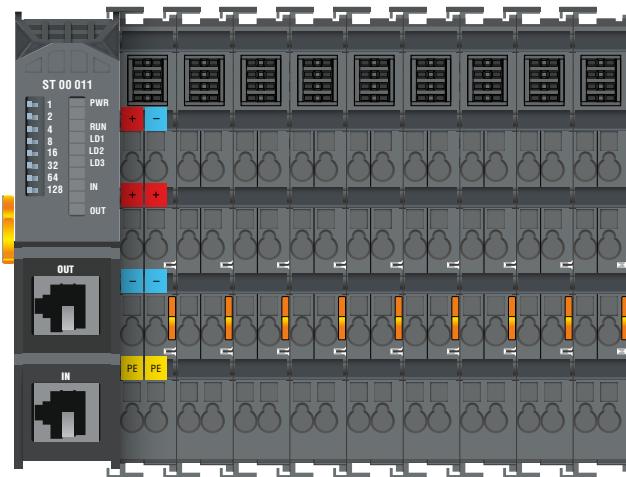

(CU) Central processor unit. CU modules have different types of modules and options. Each CU module also comes with a power supply module (PP) and plug to protect the electrical contacts of the rightmost module in the CU module rack.

(PP) Power supply modules. At least one module must be included in each rack. Number of power supply modules selected depending on the internal power consumption of each rack. For providing redundant power to the rack PLC must apply an excess amount of power supply modules. Internal power bus into rack is the one, galvanic-linked element. External power bus into rack is interrupted at the location of the power supply module and external power connected to this module is supplied only to the I/O modules located on the right hand from PP.

(AI, AO, DI, DA, DO) I/O modules have a wide nomenclature, provide processing of analog (including HART support) and digital signals (including NAMUR support), signals from TC/RTD, pulse signals (including output PWM-signals).

(CP) Communication processor modules. CP modules provide reception and operation of signals via interfaces RS-485 and protocols Modbus RTU, IEC 60870-5-101. CP modules can be installed in remote PLC's racks. CP modules provide only the physical connection devices, device driver processing executed in CU modules.

Figure 12. Example of PLC's REGUL R050 rack configuration

● Types of central processor units

Central processor unit	CU 00 021	CU 00 031	CU 00 041	CU 00 051	CU 00 061	CU 00 071	CU 00 151	CU 00 161
CPU's type					II			
Frequency, GHz, number of microprocessor cores					1 (1 core)			
RAM, Mb					512			
HDD, Gb					1			
• RS-232 / RS-485, pcs.					1			
• RS-485, pcs.					1			
• Ethernet, 100 Mbps, pcs.	1 (RJ-45)		1 (RJ-45)		1 (RJ-45) 1 (SFP)		4 (RJ-45)	2 (RJ-45) 2 (SFP)
• USB 2.0**					up to 2 ports (option)			
• GPS / GLONASS receiver					2 (option)			
• RegulBus (1xIN, 1xOUT)	-		2 (SFP)	2 (RJ-45)	2 (RJ-45)	2 (SFP)	-	-
Typical PLC's bus cycle					5 ms for each rack			
Minimal application cycle time					10 ms			
Typical number of PLC's channels at PLC's application cycle for 200 ms					Up to 800			
CPU's battery replace is available by user*					Yes			

Note: * battery In CU module provides work only for Internal clock, when external power shut off. When the CU module Is powered on with a faulty battery, the date and time in the CU can be set manually, the CU module time synchronization can be done via NTP or from the built -in GPS / GLONASS receiver;
 ** an external flash drive up to 32 GB in size can be connected via USB.

Система управления производством

INSTRUMENTAL SOFTWARE ASTRA.IDE

It's included in Government reestr
of Russian software,
№ of note 14356

Astra.IDE

Software Astra.IDE provides
hardware configuration
and algorithm development
for controllers REGUL RX00 series.

Functional availability

- visualization development kit embedded
- configuration of main PLC's parameters
- development of application program for PLC REGUL RX00
- PLC's redundancy configuration
- upload and download application to the PLC
- step-by-step debugging of application
- monitoring of PLC's operation

Programming languages

- Astra.IDE provides development of application according to IEC 61131-3:
- FBD - functional block diagram
 - LD - ladder diagram
 - ST - structured text
 - SFC - Sequential Function Chart
 - and also CFC - Continuous Flow Chart

Screenshots examples of Astra.IDE

Designer of PLC's redundancy

INTEGRATED CONTROL SYSTEM ASTRAREGUL

It's included in Government reestr
of Russian software,
№ of note № 9491\2023.

It's included in reestr of production,
which manufactured in Russia,
№ of note 9491\2023.

AstraRegul

ICS AstraRegul is modular
project-design platform for development
of APSCS any scale and complexity level.

MAIN USING AREA OF ICS

distributed control
systems (DCS)

machine monitoring systems
(vibro diagnostics)

safety instrumented
systems (SIS)

high-speed technological
process control (from 5 ms cycle)

ICS COMPONENTS

In ICS software and hardware components are included. The hardware components are:

PLC REGUL R500
and R500S series

time synchronization
servers

terminal panels

operator workstations

I/O servers

ICS engineer workstations

history servers

AMS workstations
(with PACTware using)

network equipment
(switches, firewalls, etc.)

Communications between PTC components are carried out over redundant channels using standard Ethernet-based protocols. The software components include operating systems with installed drivers and utilities that ensure the normal operation of hardware components and AstraRegul software.

ICS AstraRegul is build on PLC REGUL R500 and R500S series.

For DCS

REGUL R500

For SIS

REGUL R500S

It's used for development of important, Fault-tolerant and distributed APCS in different manufacturing industries.

It's used for development of safety instrumented systems on dangerous plants and it's approved for SIL 3 level requirements.

MAIN FUNCTIONS

data polling
and processing

software and hardware
diagnostics

process control

cyber security
and functional safety

redundancy

human-machine
interface

saving history

reports forming

event registration

BENEFITS OF ICS ASTRAREGUL

Scalability

ICS AstraRegul provides the following scale characteristics in one domain:

- up to 50 workstations;
- up to 50 PLC's CPUs;
- up to 3000 physical I/O channels for one PLC REGUL R500;
- up to 750 physical I/O channels for one PLC REGUL R500S;

Reliability

- high reliability is archived by software and hardware component redundancy
- calculated mean time between failures (MTBF) for any PLC's module is over than 150 000 hours
- average time to restore system functionality by replacing any hardware ICS component from the spare parts kit is no more than 1 hour

Fast

REGUL PLC has one high-speed internal data bus - RegulBus, which provides data exchange cycle from 1 ms.

From 10 ms

Application cycle time

Up to 1 000 000 changes / second

I/O server performance

From 10 ms

Switching time between active and standby CPU's modules

up to 750 000 changes / second

History server performance

Cross-platform

ICS AstraRegul allows cross-platform and provides developing APCS on Windows or Linux operation systems.

In instrumental software of ICS Russian and English languages are supported.

TYPICAL ARCHITECTURES

<p>ICS has three typical architectures</p> <p>For each architecture own licensing kit is needed</p> <p>All licenses are valid for an indefinite period</p>		ASTRA. LOCAL	ASTRA. PLANT	ASTRA. ENTERPRISE
				
Purpose	Architecture	Peer-to-peer systems, without redundancy	Client-server topology, redundancy support	Client-server topology, redundancy support
	Typical use	Local OWS or operator panels	APCS for plants with two redundant servers on one domain	Distributed multi-level system, above two servers in one domain
Functions	Events and alarms logger, trends of parameters	Yes	Yes	Yes
	Calculations (embedded language Om or JavaScript)	Yes	Yes	Yes
	Object-oriented model	Yes	Yes	Yes
	Data and events archive	Astra.Historian or external SQL-server	Astra.Historian or external SQL-server	Astra.Historian
	Publishing historical data for external applications (only from Astra.Historian)		OPC HDA, OPC UA, SQL	
	Upgrade to next level system	Yes	Yes	No
	WEB-access available	Yes (one client)	Yes	Yes
Client connections to servers outside the local PC (DA, A&E, HDA)	Astra.Local	No	No	No
	Клиент Astra.Plant	No	Yes, only for one pair of redundancy servers	No
	Клиент Astra.Enterprise	No	No	Yes, no limits

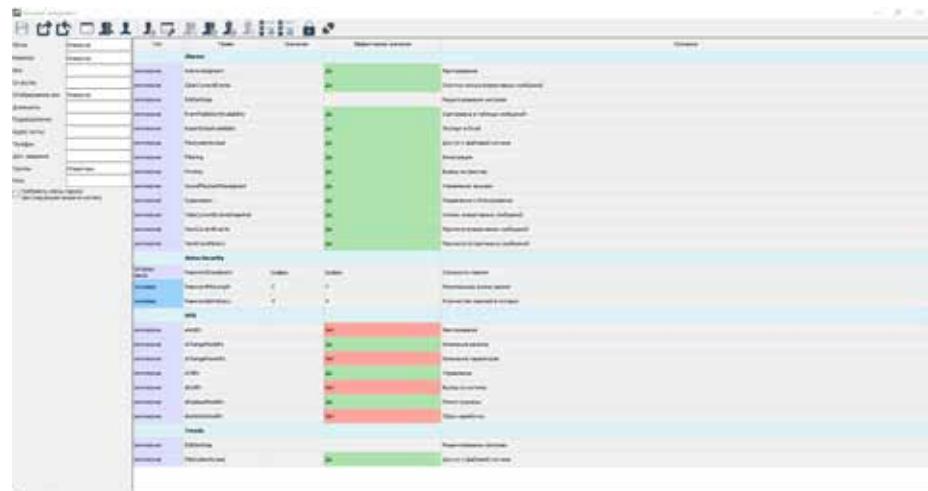

DEVELOPING

- support protocols OPC DA, OPC UA, IEC101/104, Modbus TCP/RTU, SQL, HART, etc.
- programming languages support according to IEC 61131-3
- the graphical mnemonic diagram editor has the Astra.Om programming language, which allows you to describe executable elements of scripts - procedures and formulas
- script language JavaScript support
- ability to connect ActiveX components (.NetFramework,.NetCore)
- system preinstalled libraries for developing APCS projects in various industries, the possibility of creating user libraries
- ability to debug using a virtual controller (only for REGUL R500)
- ability of multi-user development
- support for multi-monitor workstations
- ability to provide Web-access
- ability to integrate with MES and ERP systems

CYBER SECURITY

- user authorization systems with differentiation of access rights
- registration of user actions
- monitoring the integrity of the application project and its components
- setting up packet filters and "white" IP addresses for access
- using firewalls
- using anti-virus software compatible with ICS

Figure 17.
Security subsystem

LICENSING KITS FOR ASTRAREGUL SOFTWARE

● Astra.Local - Local OWS

For data archive Astra.Historian, PostgreSQL or MS SQL can be used.

Availability for WEB-access - Astra.WEBportal embedded (one client without control)

Drivers in package:

Modbus RTU/TCP Master, Modbus RTU/TCP Slave, IEC 101/104 Master, IEC 101/104 Slave, OPC DA Client, OPC UA Client, OPC DA Server, OPC UA Server, SNMP Manager, SQL, Syslog Server/Client, MQTT.

● Astra.Plant - Client-server architecture

Two servers maximum (one redundant pair) in one domain.

For data archive Astra.Historian, PostgreSQL or MS SQL can be used.

Availability for WEB-access - Astra.WEBportal embedded (clients without control)

Drivers in package:

Modbus RTU/TCP Master, Modbus RTU/TCP Slave, IEC 101/104 Master, IEC 101/104 Slave, OPC DA Client, OPC UA Client, OPC DA Server, OPC UA Server, SNMP Manager, SQL, Syslog Server/Client, MQTT, IEC 61850 Client, TEM-104 Master.

Part number	License description	Note
PLN-SRV500	• Plant.Server, 500 tags	-

A-CL-F	• Plant/Enterprise.Client Full	Client license entitles for two servers connection (one redundant pairs) one of three ways: direct, terminal, by WEB.
A-CL-RO10	• Plant/Enterprise.Client. Up to 10 connected clients without control (read only)	
A-CL-RO25	• Plant/Enterprise.Client. Up to 25 connected clients without control (read only)	
A-CL-RO50	• Plant/Enterprise.Client. Up to 50 connected clients without control (read only)	
A-CL-RO100	• Plant/Enterprise.Client. Up to 100 connected clients without control (read only)	For WEB-access clients without control are used. ATTENTION! For more than 5 simultaneous WEB-connections, the separate physical server is recommended and separate Astra.WEBportal license
A-CL-ROUP25	• Plant/Enterprise.Client. Upgrade clients without control (read only) from 10 to 25	
A-CL-ROUP50	• Plant/Enterprise.Client. Upgrade clients without control (read only) from 25 to 50	
A-CL-ROUP100	• Plant/Enterprise.Client. Upgrade clients without control (read only) from 25 to 100	

● Astra.Enterprise - Client-server architecture

Total number of tags per domain, number of physical servers, and number of client connections are licensed.

For data archive Astra.Historian can be used.

Availability for WEB-access - Astra.WEBportal embedded (clients without control)

Drivers in package:

Modbus RTU/TCP Master, Modbus RTU/TCP Slave, IEC 101/104 Master, IEC 101/104 Slave, OPC DA Client, OPC UA Client, OPC DA Server, OPC UA Server, SNMP Manager, SQL, Syslog Server/Client, MQTT, IEC 61850 Client, TEM-104 Master, BACnet, S7 Client, Ethernet/IP, FINS Client.

Part number	License description	Note

● Security keys for license

Part number	License description	Note
A-KEY-USB	• Hardware security key	-
A-KEY-SOFT	• Software security key	-
A-KEY-MOVE	• Service for transferring licenses between hardware and software keys	-

● Communication protocols (additional packages)

Part number	License description	Note
DRV-ENERG	• Additional driver package IEC 61850 Client, TEM-104 Master	Astra.Local only
DRV-INDUSTRY	• Additional driver package BACnet, S7 Client, Ethernet/IP, FINS, Client	Only for Astra.Local / Astra.Plant
A-DRV-OPCDA-CL	• External (additional Windows PC) OPC DA Client license	For Astra.Local / Plant / Enterprise
A-DRV-OPCDA-SRV	• External (additional Windows PC) OPC DA Server license	For Astra.Local / Plant / Enterprise
DRV-HART-COM	• License for Regul HART Communication for direct access to field smart sensors and actuators, connected to REGUL RX00 modules by HART. To work with field devices PACTware is required additional, also DTM-files from field devices manufacturers are required	Supplied complete with its own separate hardware security key

● WEB-access - Separate server license for WEB-access

Part number	License description	Note
A-WEB-PORTAL	• License for WEB-access to Plant and Enterprise servers (for data publishing by WEB separate WEB-server must be installed, for example IIS, Apache etc.) Attention! Additional separate read-only client license are required	Only for Plant/Enterprise

● Development tools

Part number	License description	Note
A.Studio	• Instrumental software for project development of I/O servers and history servers	-
Astra.IDE	• Instrumental software for development of PLC's application	-
